Introduction

The purpose of this report is to provide a strategy for the management and implementation of surface water drainage for the proposed development of a indoor training facility at the Wath Brow Hornets, Wath Brow, Cleator Cumbria (thereafter referred to as Site). The report has been commissioned by owners, for the purposes of assisting the planning process.

Research has been undertaken on the site and observations made regarding the existing site and its former history.

The report should be read in conjunction with the documents referenced to it, generally appended to this report, and all works has been designed in accordance with the following standards :

- CIRIA Publication C753 The SuDS Manual
- CIRIA Publication C768 Guidance on the Construction of SuDS

Calculations associated with the drainage have been performed by online packages from a recognised resource. Where appropriate copies of calculations are provided in the Appendices of this report.

Existing Site and Drainage

Surface Water

The site currently comprises a parcel of land approx 12,000 m² which is the overall site used for by Wath Brow Hornets, including car parking, changing facilities, bars, spectator areas and the rugby pitch.

At present, local drainage around the site and pitch collect flows from impermeable areas and areas with formal drainage to the north east corner of the site where the surface water enters a formal drain and passes down toward the River Ehen via a formal arrangement. Beyond the site boundary, the exact arrangements for drainage are unknown and untraceable.

From discussions with neighbours to the site, it is noted that surface water runoff from the site flows towards the rear garden at No 92 Trumpet Road and over time, this has historically flooded during periods of heavy rainfall.

Foul Water

The site is presently serviced by mains foul drainage to the north west where it enters the public sewer network maintained by United Utilities. The exact arrangements of the existing network from the site were not fully investigated.

Drawing 20-105 DWG001 indicates the existing drainage on the site.

Ground Conditions

Ground conditions published by the British Geological Survey indicates that the site is underlain by Diamicton Till generally comprising sandy clays and the solid geology comprises Buttermere Formation, generally a sandstone / mudstone identified locally.

Trial pits were conducted on the site by Toman Contractor, and this indicated that the site was generally reworked gravelly clays and a large amount of imported materials comprising inert granular building waste.

Proposed Drainage Strategy

Surface Water

It is proposed that the development will discharge to the existing surface water network servicing the site. The existing network is well maintained and operational, and the additional non permeable roof area is a small proportion of the overall area carried by the drainage system.

The removal of informal drainage to ground around the proposed area of the site will also alleviate the potential runoff and flooding to adjacent properties, gardens and allotments areas.

Roofs will drain into proprietary rainwater goods present on each side of the building. This will carry water into the surface water system located around the building and discharge to a new pipe carrying the surface water system into the existing surface water network.

CCTV Surveys will be conducted on the existing network to ensure it is fit for purpose and in good condition at the time of the works.

Existing permeable surfaces and areas will be maintained and if appropriate, remedial works performed on these elements, including resurfacing with suitable imported materials, and cleaning.

Foul Water

It is not proposed that foul water will be required in the training facility and existing facilities will be used on the wider site.

Detailed Design

Surface Water

Calculations have been undertaken in UK SUDS to identify the overall site runoff. The following table indicates these greenfield flow rates for the overall site.

Storm Event	Greenfield Flow Rate (l/s)
Qbar	12.35
1 in 1 year	10.75
1 in 30 years	21
1 in 100 years	25.69
1 in 200 years	29.27

Based on the roof area of the proposed training facility, calculations undertaken in Tekla TEDDS software to calculate the required attenuation volume for the proposed impermeable areas of the new training facility based on greenfield runoff rates. From these calculations, attenuation of 15cuM based on the 1 in 100 year storm event plus 40% climate change has been calculated.

This will be in the form of stormcell crates or similar buried in the remaining car park area and outfalling to the existing surface water network. We consider this an appropriate solution and would limit any increases in flows to the existing system during storm events. It would also prevent any flooding occurring within the site and to the neighbouring properties.

Calculations

Calculated by:	Colin Aimers
Site name:	Wath Brow Hornets
Site location:	Cleator

This is an estimation of the greenfield runoff rates that are used to meet normal best practice criteria in line with Environment Agency guidance "Rainfall runoff management for developments", SC030219 (2013), the SuDS Manual C753 (Ciria, 2015) and the non-statutory standards for SuDS (Defra, 2015). This information on greenfield runoff rates may be the basis for setting consents for the drainage of surface water runoff from sites.

Runoff estimation approach

Site characteristics

Total site area (ha):

Methodology

Q_{BAR} estimation method:

SPR estimation method:

Soil characteristics

	Default	Edited
SOIL type:	4	4
HOST class:	N/A	N/A
SPR/SPRHOST:	0.47	0.47

Hydrological characteristics

	Default	Edited
SAAR (mm):	1337	1337
Hydrological region:	10	10
Growth curve factor 1 year:	0.87	0.87
Growth curve factor 30 years:	1.7	1.7
Growth curve factor 100 years:	2.08	2.08
Growth curve factor 200 years:	2.37	2.37

Notes

(1) Is Q_{BAR} < 2.0 l/s/ha?

When Q_{BAR} is < 2.0 l/s/ha then limiting discharge rates are set at 2.0 l/s/ha.

(2) Are flow rates < 5.0 l/s?

Where flow rates are less than 5.0 l/s consent for discharge is usually set at 5.0 l/s if blockage from vegetation and other materials is possible. Lower consent flow rates may be set where the blockage risk is addressed by using appropriate drainage elements.

(3) Is SPR/SPRHOST ≤ 0.3?

Where groundwater levels are low enough the use of soakaways to avoid discharge offsite would normally be preferred for disposal of surface water runoff.

Greenfield runoff rates

	Default	Edited
Q _{BAR} (l/s):	12.35	12.35

ATTENUATION DESIGN

In accordance with CIRIA publication C753 - The SUDS Manual

Tedds calculation version 1.0.04

Allowable discharge method

Site characteristics

Location	Carlisle
Hydrological region	10
Soil type (Wallingford Procedure W.R.A.P map)	4
Standard percentage runoff	SPR = 0.47
Average annual rainfall	SAAR = 800 mm
5 year return period rainfall of 60 minute duration	M5_60min = 17.0 mm
Ratio 60-minute to 2 day rainfalls of 5 year return	r = 0.35
Rainfall intensity increase due to global warming	P _{climate} = 40%

Catchment details

Subcatchment	Name	Area (ha)	PIMP (%)	Impermeable area (ha)
1;	New Training;	0.03;	100.0	0.03;
Total		0.03;	100.0	0.03;

Greenfield runoff rates

Catchment area	AREA = 50.00 hectare
Greenfield runoff rate (50 hectare site)	$\bar{Q}_{\text{rural}} = 0.00108 \text{ m}^3/\text{s} \times (\text{AREA}/1\text{km}^2)^{0.89} \times (\text{SAAR}/1\text{mm})^{1.17} \times \text{SPR}^{2.17} = 282.2 \text{ l/s}$
Greenfield runoff rate	$\bar{Q} = \bar{Q}_{\text{rural}} / \text{AREA} \times A = 0.1 \text{ l/s}$
Greenfield runoff rate per unit area	$\bar{Q}_A = \bar{Q} / A = 5.6 \text{ l/s/hectare}$

Estimated site discharges

FSR growth rate (2 year)	FSR _{2yr} = 0.91
Discharge (2 year)	Q _{2yr} = $\bar{Q} \times \text{FSR}_{2\text{yr}} = 0.1 \text{ l/s}$
FSR growth rate (30 year)	FSR _{30yr} = 1.70
Discharge (30 year)	Q _{30yr} = $\bar{Q} \times \text{FSR}_{30\text{yr}} = 0.2 \text{ l/s}$
FSR growth rate (100 year)	FSR _{100yr} = 2.08
Discharge (100 year)	Q _{100yr} = $\bar{Q} \times \text{FSR}_{100\text{yr}} = 0.3 \text{ l/s}$

Table equations

Total surface water	$V_w = A_{\text{imp}} \times M$
Permitted discharge	$Q_{\text{allow}} = Q_{2\text{yr}} \times D$
Storage volume required	$V_{\text{req}} = V_w - Q_{\text{allow}}$
